

- Technically Speaking -

What is 24 bit/96kHz digital technology with 3-D surround sound processing ?

While most digital recordings are done using 16 bit technology, we at Rhyme Records believe that in order to capture and reproduce true-to-life performances, one must use the highest form of resolution available.

The advantage of 24-bit recording over 16-bit recording is a more natural, uncolored sound with an overwhelmingly wide dynamic range ensuring that even the finest musical nuance is captured faithfully. With the employment of 3-D surround sound processing, the musical sound stage expands to reveal a greater sense of depth and realism.

All Rhyme Records recordings are now done exclusively using 24-bit/96kHz technology with 3-D surround sound processing to ensure true life-like performances with unsurpassed depth and realism.

Rhyme Records providing you with the highest quality product time and time again.
